FERTILIZERS FOR POTATOES

PROPER METHODS OF MANURING FOR LARGE YIELDS.

w to Make a Hotbed-Feeding Stock for Growth-Points for Profit in Poultry-Farmers as Grumblers -General Notes.

Potatoes are and always have been a favorite crop with us, but although we try to have a little surplus to sell for seed in the spring, we have never yet tried to raise them on a large scale for most her end of raising any other crop than that of potatoes, both Irish and sweet. We hove to raise, both Irish and sweet. We hove to raise them, first, because we find them a very easy crop to raise; second, they are one of the surest crops to raise, in the last twenty-flee years we have never lost a crop of potatoes, with the exception of one single year. Isi, and then we overrid the property of potatoes, with the exception of one single year. Isi, and then we overful a crop of potatoes, both Irish and sweet, we have discarded; third, because as an article of food we find them healthful and economical, and fourth, because we have always found them halfly profitable.

We think the main reason we have always found such fine, large, smooth potatoes is because we farnish them with potatoes were always more or less rough and scabby, while now they invariably turn out smooth and clean. We avoid scab, first, by never planting scabby potatoes, and second, by never planting potatoes on land intested with scab germs, or in other words, in the property of the potatoes. We have repeatedly noticed that the scab of potatoes was invariably present in a raito exactly corresponding with, first, the amount of manure was used, and in the drill in immediate proximity to the potatoes.

And in the drill in immediate proximity to the potatoes.

When the drill in immediate proximity to the potatoes.

And in the drill in immediate proximity to the tubers, a very scabby lot of tubers was the invariable result, We also found that where the manure was well rotted before being applied. So also know the manure was supplied, and in the drill in immediate proximity to the tubers, a very scabby lot of tubers was the invariable p

applied in this experiment was 57.19. The increased yield caused by the use of fertilizers was at the ratio of one hundred and which produces the muscle, cartillages, which at 40 cents per bushel, amounts to the sum of 364.53½, leaving a net profit of \$57.53½, per acre, less the increased labor required to take care of the increasing control of \$2.500 and the profit per acre from the use of muriate of polash was \$12.00; from kainti, \$16.67. At the North Carolina star from an investment of \$2.50.

Value of Sorghum for Farage.

Correspondence Kansas Farmer: You take a great interest in the introduction of alfalfa clover for hay and fodder, which is sight of the most valuable hay or fodder plant for the average farmer to raise as a sure crop for feed in winter, and that is the old, time-tried sorghum cane plant. Sight of the most valuable hay or fodder plant for the average farmer to raise as a sure crop for feed in winter, and that is the old, time-tried sorghum cane plant, less for a feed rop. Milet all the process of which it is composed are to sum of a quantity of tons per acre, nor to stand drouth or chinch bugs. There are many of our papied tarmers, who, it may be a supported to the process of making four the for feed last year, could have done well. The cane would have made all the feed have sold their who or prairie hay that was the substances of making four, control and times all the feed have sold their who or prairie hay that was the substance of making four, control the control of the most value of the past season has been, it makes it too expensive, when without any care, simply by plowing the ground well in May or June and sowing the seed and harrowing in, or, better, drill same as wheat, and you are done till feed and corn fooder to too great an extendition, and the stock will eat it and get fat on it if given all they want to the control of the contro kainli, Siest. At the North Carolina station, kaut alone yielded a profit of station, the control of the profit of station of the control of

inches at the front, according to the kinds of plants to be grown. The height at the front however, depends on the width of the bed.

Fresh horse manure, free from litter, is generally used. It is the fermentation of the manure which creates the heat. If the manure is too loose it may create heat more rapidly than desired. It is better to mix the manure in a pile, allow it to heat some, and then turn it over and mix it well again before using it in the hotbed. Having trampled the manure firmly, now cover it with rich dirt, to which has been added one-fourth its bulk of fine, well rotted manure. There should be no lumps, stones or pebbles in the hotbed. If necessary sift the dirt. The thickness of the dirt should be about ix inches. As there will then be about a foot of space between the dirt and the sash, the hotbed being twenty-four inches at the rear, ample air space will thus be provided. If the manure does not heat up quickly and is too slow, sprinkle the bed well with hot water, first adding a small quantity of air slaked lime to the water. If too much heat is generated, use cold water alone. When the heat reaches about 60 deg, plant the seed in rows, but more warmth will be required for the young plants later on.

Of course, the frame should be well banked up with dirt, to prevent the effects of frost. The object should be to maintain as even a temperature as possible. On clear, warm days the sash may be raised slightly in order to admit air during the middle of the day, but this will depend on many circumstances. The better plan is to hang a thermometer in the hotbed, and to visit it frequently. As the heat from the manure decreases the weather will become warmer. Gradinally accustom the plants to the temperature of the outside atmosphere as much as possible and transplant to the cold frame such as may be suitable for that purpose. Some sort of covering should be used over the sash fit night, such as an old carpet, with a few loose boards over the carpet. The temperature of the atmosphere must be the gui

liavors.

To grow animals or crops of any kind with most profit, they should have all the good, well prepared food they can utilize. This, to the fruit grower, means rich soil, well prepared, and always in good condition. tion.
It is imperative that all poor plants be discarded. Weak plants cannot produce vigorous growth or fine fruit.
Practice careful selection, keep only the best, produce only the best, grade up with

Philadelphia Record; When it is desired to force young animals to grow rapidly the food must be of a character suitable for that purpose. Bone and muscle are of more importance than fat. The animal intended for market fattens more readily as it approaches maturity, but some young animals will not fatten at all, as the food conduces more to growth than to fat. If the food is not adapted for promoting growth the young animal though growing will not gain as rapidly as when the food is more appropriate. It is the mineral matter in foods (lime, phosphoric acid, etc.) that creates hone, and the protein, or nitrogenous element, which produces the muscle, cartilages, hide, etc. The carbonaceous matter, producing fat, is only necessary for a young animal in warming the body. Animals gain more rapidly when very young than

Points for Prof t.

Strawberries.

M. A. Thayer: Every man, woman and child having a rod of ground should grow strawberries. They may be produced on almost any soil, and a child may grow ihem. There is no fruit so delicious, none more productive, none more healthful, none so easily grown, none so cheaply grown and casily protected from the hot winds and drouth of the summer or the blizzard winters of the Northwest. It is the rich man's berry; it is everybody's berry; and should be as universally grown as wheat, corn or polatoes.

The same common sense that grows a good pig, a good cow, or a good crop of grain will just as surely grow a good crop of strawberries. In fact, the process is about the same.

You cannot grow good pork from a weak, sickly plan.

Always get the best, whether pig or plant. The soil is a storehouse for plant. The soil is a storehouse for plant food. It is the most convenient place for keeping raw material to be converted into agricultural and horticultural products, as needed. It is a bank of deposit for fertility. All may do business at this bank, but the inner doors are many, the locks formed by nature's own cunning hand, and one must work the combination well to succeed best.

Berry plants are huge feeders and hard drinkers they require the atmosphere and the fact of poor appearance of the car-most of poultry do not know the good from the inferior, being guilded, sold the work the good from the inferior, being guilded, sold the sold of the market of poultry do not know the good from the inferior, being guilded, sold the sold of the market of poultry do not know the good from the inferior, being guilded, sold of the miertor, being guilded, sold of the miertor, being guilded, sold the open of the sax of poultry do not know the good from the inferior, being guilded, sold with color of the eggs and skin the sold with eart who will trade the fact of poultry do not know the good from the inferior, being guilded, sold with eart of poultry do not know the good from the inferior, being guilded, sold with eart of p

Thoroughbred Pontry.

Country Gentleman: Better advice cannot be given to any farmer going in for poultry than to select a pure breed and stick to it so long as it meets the demand of his trade. What this choice shall be must be determined by the place and market requirements. In this country the advice that Plymouth Rocks are the best fowls, for farmers would not apply if first-class table poultry were desired. Valuable though this variety is, its yellow flesh would be a fatal barrier to the realization of top prices, for we must have white-fleshed birds, as they are regarded as the finest in flavor, as well as preferable in appearance. In such places, however, where large birds are demanded, and the color of the flesh is not regarded as of chief moment, this breed is excellent, and they have a most valuable quality, in that they mature quickly, and also are excellent winter layers. It only needs that the poultry breeder shall study his conditions and market, discover what breed will fit them best and then run on these lines, avoid the chopping and changing which is so fatal to success in any industry. Again, I would say, select a pure breed and stick to it.

Remedies for Unprofitable Farming.
Practical Farmer: In order that one may work with certainty and efficiency for the removal of ills of any kind or degree, it is necessary to first learn the causes which have brought about the unfaverable conditions from which he is suffering.

One of the contributors to the department of "Mistakes and Failures" has illustrated this principle in a communication which appeared in the Practical Farmer: Mentioning his want of success, he says: "I thought the tariff was at fault, the railroads to blame and things generally going to the bad." But after reading agricultural papers, attending a farmers' institute and giving careful thought to the subject, this farmer found that the larger part of his troubles were not due to the tariff, or the railroads, or a demoralization of things in general, but came from his own faulty methods and practices. And it is interesting to note, without any improvements in the tariff, or the railroads, or in the general condition of affairs in the country at large, he has Remedies for Unprofitable Farming.

methods, he will not be able to secure logislation or anything clae that will give him
the success which he desires.

Farmers as Grumblers.

Canadian Farm Journal: Farmers,
whether rightly or wrongly, have, from
time immemorial, heen set down as chronic
grumblers. The charge, we fear, is true
in many cases, but we doubt whether,
after all, farmers grumble more than any
other class of men. We are all very much
too apt to grumble if everything does not
too just as we wish, and, therefore the sigling out of the farmer as the most representative grumbler seems to us like a calunit is urged against the farmer that he is
always grumbling about the weather. Well,
if he is, what profession is there whose interests are more affected by the weather
that his are? Favorable weather is a
necessity to him will through the seamon,
from spring to winter. Without favorable
weather he caintof prepare his land for his
crops; without it he cannot sow them
growth and development of them and if
growth and development of them and if
growth and development of them and in
